

# Setting Up a Website with a Crash Course on HTML and CSS

JOSEPH GUTIERREZ

## Easy Options:

- <https://www.squarespace.com/templates/>

- <https://www.wix.com/>

← Actually Free. Like for everything.

- <https://colorlib.com/wp/templates/>

# But you are a CS student so you should at least know HOW to set up a website

## PROS TO LEARNING

- Show off skill to a potential client/employer
- Be self-reliant
- Some classes do require you to build a website. Might as well learn now.
- Lots of professional work options
- You're officially a cool kid 
- Having something YOU built online is a hella cool feeling.

## CONS TO LEARNING

- Takes some time
- Costs a little bit of money (Only to publish. You can build for free)
- .... I can't think of another  
~\\_(\ツ)\\_/~

# Experience

- [www.epas.com](http://www.epas.com)
- [www.utep.edu/provost/](http://www.utep.edu/provost/)
- [www.traviswhitena.com](http://www.traviswhitena.com)

# Example Site for Today

[Home](#) [Who We Are](#) [Calendar](#) [Agendas](#) [Meet The Officers](#) [Gallery](#) [Contact Us](#)

TRAVIS WHITE  
NEIGHBORHOOD ASSOCIATION  
TO PRESERVE THE INTEGRITY OF A PRAISEFUL AND AESTHETICALLY PLEASING COMMUNITY

Part of District 7 in El Paso, Texas  
Representative Henry Rivera

Thursday, September 6th, 2018

### Announcements

#### Upcoming Meeting

Please join us at our next meeting on September 4th, 2018. The Agenda is posted [here](#)

#### Rummage Sale Donations

Travis White Neighborhood Association would like to thank the community both inside and outside of TWNA for their wonderful donations and help during the Rummage Sale on May 19th, 2018.

#### Rummage Sale Result

Thanks to the generous donations and volunteerism of our wonderful neighbors both inside and outside Travis White on the May 19th,

# Tools We Will Need Today

VISUAL STUDIO CODE-  
INSIDERS

FILEZILLA

We Will Also Need

CHROME

OR

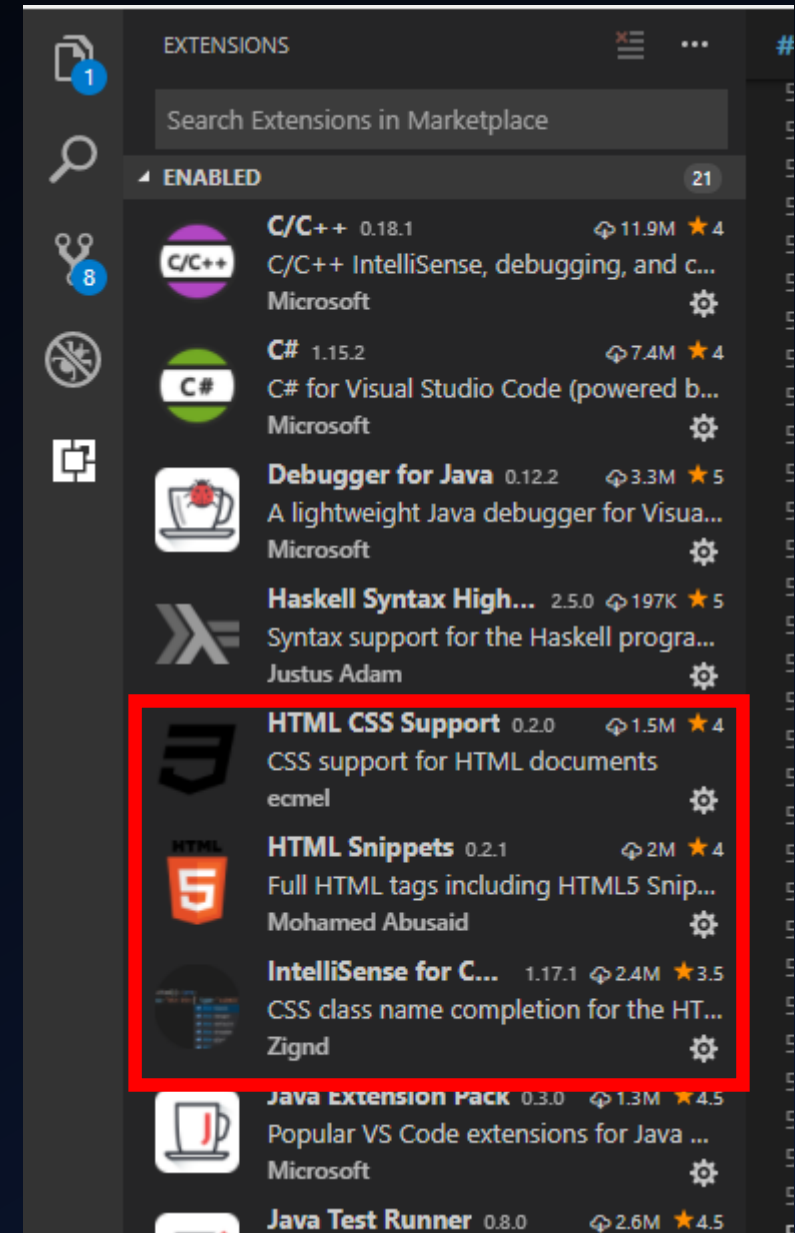

FIREFOX

# Visual Studio Code -Insiders

- Fast, Light-weight
- Almost IDE but so much better
- Intelli-sense
- Built-in Command Line
- Built-in Version Control
- Open Project Folders
- Pop Ups
- Multiple Cursors
- Endless Extensions
- Color Thingy

# FileZilla

- Any FTP software would work
- This is MY Favorite
- GUI Interface
- FREE

# Firefox

- I prefer Firefox
- Better developer tools, (In My Opinion)
- Ctrl + Shift + I opens developer options in most browsers

Domain Name

Server

+

+

Code/Website

Need to Buy ☹️

You build 😊

# HostGator

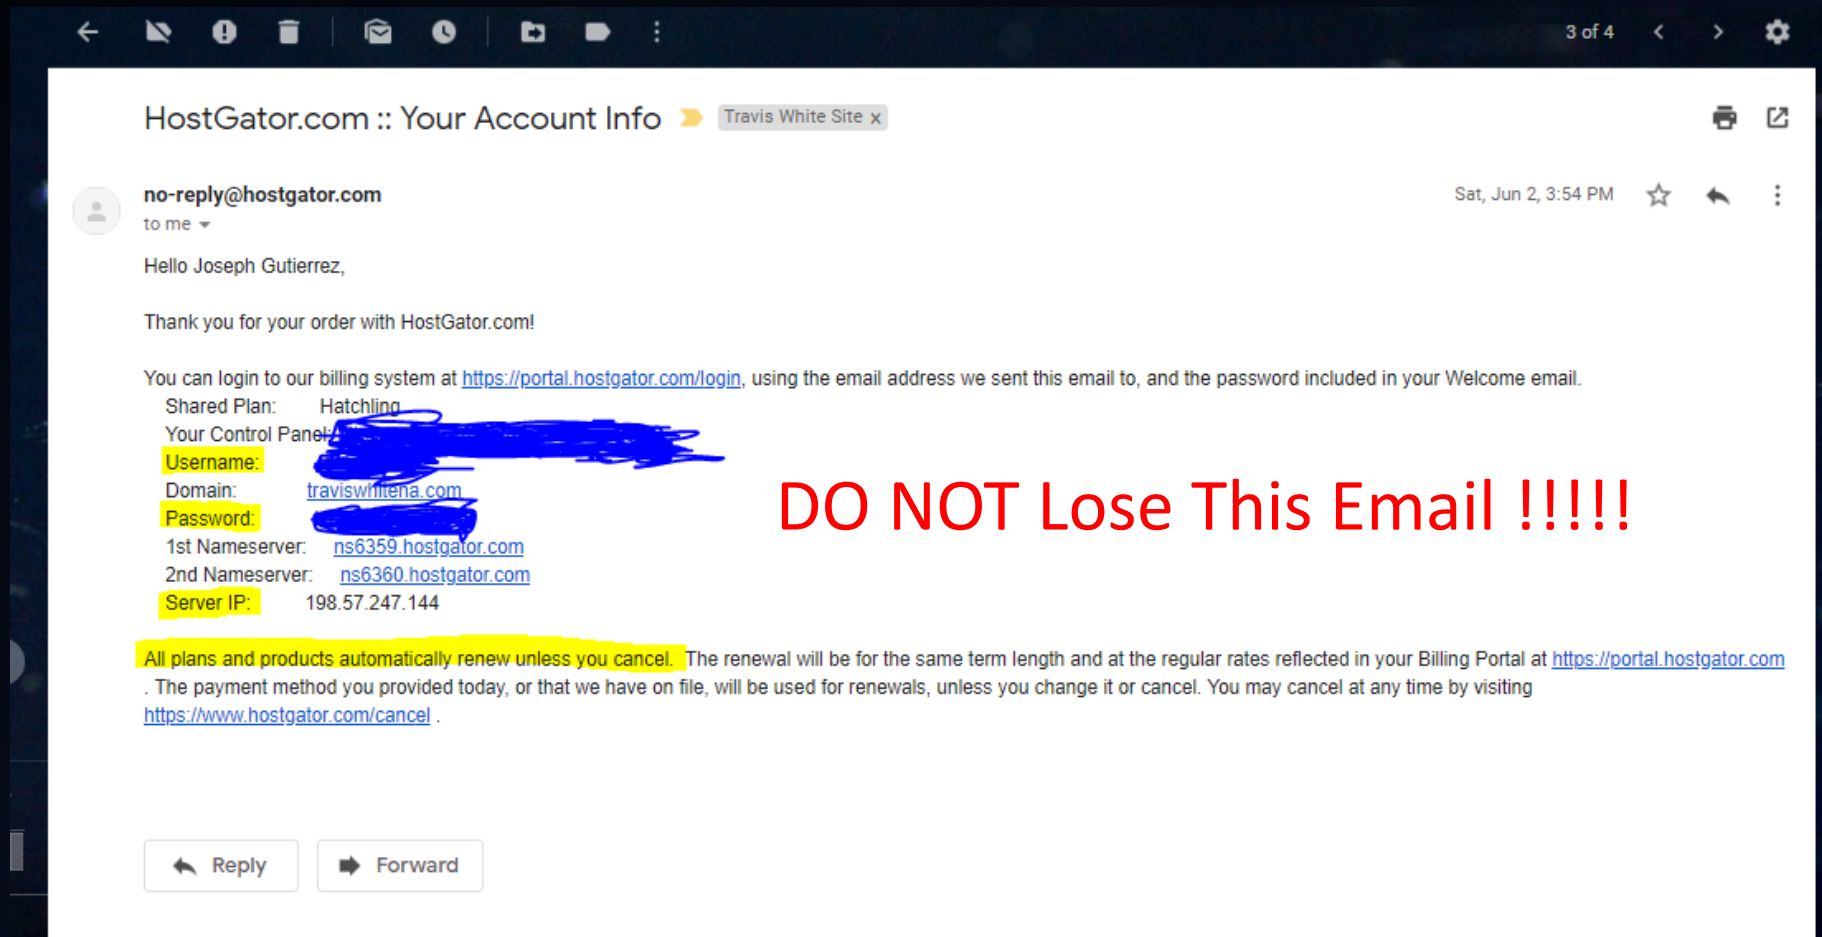

- <https://www.hostgator.com>
- Reliable and easy to use
- Domain Name Pretty Cheap
  - (about \$13/yr for a .com, starts at \$0.95/yr for others)
- Hosting (Server)
  - (Price depends on how long you want the hosting. Cheapest walk away price is \$10.95)
- Pay the \$15 for the Domain Privacy Protection

-------------------	-----------	-------------	------	----------	--------

It says "public\_html"

# General Rules for Website Servers

- Your files go in “public\_html” folder
- These files are PUBLIC so only put things that are okay for people to see
- **DO NOT** ERASE ANYTHING THAT IS ALREADY THERE
- When in doubt, Google it out.

# If Your Domain Name Does Not Work Right Away

- Don't freak out!
- It's okay!
- DNS takes time to update
- If you have already uploaded files, just type in the IP of the server as a URL (That SHOULD work)
- Check back in an hour
- Could take up to 24 hours to update DNS (usually takes about 1 hour)

# Now Let's Talk About Building

# Creating Files

HTML, CSS, AND MEDIA, OH MY

# Recipe For a Website

+

+

^^Zero or more of these^^

# Recipe For a Website

Backbone

+

Decoration

+

Other Stuff

# HTML

- Hyper Text Markup Language
- Backbone of internet
- Actual text
- Links things together

# CSS

- Cascading Style Sheets
- Adds decoration and stylization to back bone
- Can do SO MUCH more than you think
- CSS Grid 

# Javascript

- Client side Language
- Great for animations
- Can be used for a ton of stuff
- Security risks because trusted
- Some users do not trust and turn off
- Lots of games are coded in JS
- (Nothing to do with Java)

# MySQL

- Used for databases
- Needs another language to connect to server and query stuff
- Most SQL (Structured Query Languages) are similar

# PHP

- Server side language
- Great for scripting
- Secure
- Often used when need to access/use databases
- Great for forms
- HUGE time saver

# Ruby On Rails

- Github is written in it
- Can do a ton of cool stuff
- I don't know too much about it but people who use it treat it like a pseudo religion
- Apparently its pretty good  
-\\(ツ)\_/-

# HTML

CONTENT OF YOUR SITE

# Base Code

```
<html>  
  <head>  
    <title> My First Website</title>  
  </head>  
  <body>  
    <!-- This is where content goes -->  
  </body>  
</html>
```

# Headings

```
1 <h1>Heading level 1</h1>
2 <h2>Heading level 2</h2>
3 <h3>Heading level 3</h3>
4 <h4>Heading level 4</h4>
5 <h5>Heading level 5</h5>
6 <h6>Heading level 6</h6>
```

Here is the result of this code:

## Heading level 1

### Heading level 2

#### Heading level 3

##### Heading level 4

###### Heading level 5

###### Heading level 6

<p></p>

# Common Text Markup

- Paragraph - `<p> This is a paragraph </p>`
  - (Text in code is not directly shown. Need several `<p></p>` to make more paragraphs. `"\n"` in code does nothing.)
- Line Break - `<br>`
  - Basically is a `"\n"` in HTML
- Link - `<a href = " " > This is a link </a>`
  - `<a href = "https://www.google.com" >Google</a>`
  - `<a href = "gallery.html" >Internal page named "gallery.html"</a>`

# Common Text Markup

- Comments - `<!-- This is a comment. Seen on code. Not by page. -->`
- Bold - `<strong> This is bold text </strong>`
- Italics - `<i> This is italicized text</i>`
- Underline - `<u> This is underlined text </u>`

# Images

- It is generally recommended to use a folder to organize images
- Images - `<img src = "Images/image001.jpg">`
- If an Image does not or cannot load, you should have an "alt">
  - `<img src = "Images/image001.jpg" alt = "Example Image">`

# Lists

## BULLETED LISTS (UNORDERED LISTS)

`<ul>`

`<li>List Item 1</li>`

`<li>List Item 2</li>`

`<li>List Item 3</li>`

`</ul>`

## ENUMERATED LISTS (ORDERED LISTS)

`<ol>`

`<li>List Item 1</li>`

`<li>List Item 2</li>`

`<li>List Item 3</li>`

`</ol>`

# Tables

Result Size: 668 x 482

```
<table style="width:100%">
  <tr>
    <th>Firstname</th>
    <th>Lastname</th>
    <th>Age</th>
  </tr>
  <tr>
    <td>Jill</td>
    <td>Smith</td>
    <td>50</td>
  </tr>
  <tr>
    <td>Eve</td>
    <td>Jackson</td>
    <td>94</td>
  </tr>
  <tr>
    <td>John</td>
    <td>Doe</td>
    <td>80</td>
  </tr>
</table>
</body>
```

## Basic HTML Table

Firstname	Lastname	Age
Jill	Smith	50
Eve	Jackson	94
John	Doe	80

# Divs

- Divs are basically just containers
- Divs are super important in positioning and targeting items with CSS.
- `<div> </div>`

# Classes and IDs

- Every Item can have several Classes and one ID
- Classes and IDs help CSS know what items to format by which rules
  - `<p class = "class1"> Class 1 formatted text </p>`
  - `<p class = "class1 class2"> Class 1 and Class 2 formatted text </p>`
  - `<p class = "class1" id = "exampleParagraph"> Class 1 formatted text that is specifically targeted by the exampleParagraph id </p>`

# CSS

MAKE YOUR SITE PRETTY

# Good CSS Habits

THE KEY TO CLEANER CODE AND LESS  
WASTED TIME

# What NOT To Do

- You can individually style elements like this:
  - `<p style = “-CSS goes here-”> Text </p>`
- You can add CSS to a page like this:

```
<html>
```

```
    <head>
```

```
        <title> My First Website</title>
```

```
        <style> -CSS goes here- </style>
```

```
    </head>
```

```
    <body>
```

```
        <!-- This is where content goes -->
```

```
    </body>
```

```
</html>
```

# Why Not To Do That

- Either of these approaches work fine for a one page site
- Once your page grows to 2, even 3 pages it will be a nightmare to update, change, find what targets what, etc.
- You cant reuse code

Keep code “DRY”

Don't

Repeat

Yourself

# What to do

1. Create a file called “stylesheet.css”
2. Put all your CSS in this file
3. Add a link to the file in the `<head> </head>` of each page/file you create
  - `<link rel = “stylesheet” type = “text/css” href = “stylesheet.css”>`
4. Smile because you just saved yourself SO MUCH work

# CSS Rules

CODING ACTUAL CSS

# CSS Rules

## FOR A CLASS

```
.className{  
    border: 2px solid black;  
    text-align: center;  
}
```

## FOR AN ID

```
#IDName{  
    border: 2px solid black;  
    text-align: center;  
}
```

# More Targeting

## SEVERAL CLASSES

```
.className, .className2{  
    border: 2px solid black;  
    text-align: center;  
}
```

## SPECIFYING NESTED ELEMENTS

```
.class1 h3{  
    border: 2px solid black;  
    text-align: center;  
}
```

Example:

```
<div class = "class1">  
    <h3> TARGETED</h3>  
</div>
```

# Tag Targets

- You can target tags as targets like this:

```
p, h1 {  
    -CSS rules here-  
}
```

- Used to ensure consistent look across site:

```
html, body{  
    background: #eee;  
    margin: 0;  
    padding: 0;  
    height: 100%;  
    width: 100%;  
}  
  
h1, h2, h3, h4, h5, h6, p, div, a,  
li, td, th{  
    font-family: "Lato", sans-serif;  
}
```

# CSS Box Model

# CSS Shorthands For 4 Sided Stuff

Using Margin as Example:

margin-top: 0;

margin-left: auto;

margin-bottom: 0;

Margin-right: auto;

margin: 0 auto 0 auto;

margin: 0 auto;

# Pro Tips

## Pro Tips

- Compress your pictures
- ALWAYS design for mobile first
- Before you start coding anything, draw out the structure of your site and rough ideas of how you want things to look
- If you make changes that don't appear in the next refresh, Ctrl + F5

## Pro Tips

- PHP is amazing for repetitive tasks
- CSS Grid is the best thing ever for formats
- Focus on content over aesthetics (You can tweak a website until you die and still not be happy with it)
- Remember everyone has been where you are at some point.

## Pro Tips

- It doesn't have to be THAT Expensive
- I cheated a bit on what you have to pay
- <https://www.youtube.com/watch?v=vzojwG7OB7c>
- What I did ^^^

DEVICES OUT THERE

# Units of measurement

Unit	Description	Example
%	Defines a measurement as a percentage relative to another value, typically an enclosing element.	p {font-size: 16pt; line-height: 125%;}
cm	Defines a measurement in centimeters.	div {margin-bottom: 2cm;}
em	A relative measurement for the height of a font in em spaces. Because an em unit is equivalent to the size of a given font, if you assign a font to 12pt, each "em" unit would be 12pt; thus, 2em would be 24pt.	p {letter-spacing: 7em;}
ex	This value defines a measurement relative to a font's x-height. The x-height is determined by the height of the font's lowercase letter x.	p {font-size: 24pt; line-height: 3ex;}
in	Defines a measurement in inches.	p {word-spacing: .15in;}
mm	Defines a measurement in millimeters.	p {word-spacing: 15mm;}
pc	Defines a measurement in picas. A pica is equivalent to 12 points; thus, there are 6 picas per inch.	p {font-size: 20pc;}
pt	Defines a measurement in points. A point is defined as 1/72nd of an inch.	body {font-size: 18pt;}
px	Defines a measurement in screen pixels.	p {padding: 25px;}
vh	1% of viewport height.	h2 { font-size: 3.0vh; }
vw	1% of viewport width	h1 { font-size: 5.9vw; }
vmin	1vw or 1vh, whichever is smaller	p { font-size: 2vmin;}

# Units of measurement

Unit	Description	Example
%	Defines a measurement as a percentage relative to another value, typically an enclosing element.	p {font-size: 16pt; line-height: 125%;}
cm	Defines a measurement in centimeters.	div {margin-bottom: 2cm;}
em	A relative measurement for the height of a font in em spaces. Because an em unit is equivalent to the size of a given font, if you assign a font to 12pt, each "em" unit would be 12pt; thus, 2em would be 24pt.	p {letter-spacing: 7em;}
ex	This value defines a measurement relative to a font's x-height. The x-height is determined by the height of the font's lowercase letter x.	p {font-size: 24pt; line-height: 3ex;}
